

Tenax TeBlossom Green/Blue Stain Removal Kit

This process will take at least two days to complete, possibly more depending on how stubborn the green/blue stains are. This is not a quick fix kind of problem.

Tenax TeBlossom Kit Contents: Two bottles, Reagent #1 clear liquid and Reagent #2 pink cream.

Other items needed:

- Poultice powder such as Diatomaceous Earth (DE)
- Bowl for preparing the poultice
- Mixing sticks to stir the poultice
- Plastic wrap to cover the poultice
- Plastic tape to seal the poultice
- Acetone to clean the stone
- Bleach
- Paper Towels to apply bleach
- Propane torch to heat the stone (possibly)

Procedure:

- Identify the areas that need treatment. Take a picture to compare with result after treatment.
- Dispense equal amounts of Reagent #1 and Reagent #2 into the bowl and mix well.
- Add sufficient DE powder to obtain a poultice of toothpaste consistency. Mix well.
- Spread the poultice over the green/blue stain going past the stain by at least ½ inch.
- Cover the TeBlossom poultice with the plastic wrap and tape the edges with the plastic tape but leave a section without the tape to allow for venting of gases that are produced.
- Beware the TeBlossom poultice has a sweet smell so keep out of reach of children and pets.
- Let the TeBlossom poultice stand for 24 hours then remove the poultice and inspect the area treated.
- Compare with the picture taken, the stain should have turned from green/blue to yellow.
- If a change of color has not occurred repeat the above procedure.
- **Once the area has turned yellow proceed to the next step.**

- Clean the surface with water first and then with acetone to remove any residue poultice.
- Make a poultice of DE powder and bleach to a toothpaste consistency.
- Spread the DE-Bleach poultice over the now yellow area, going past the stain by at least ½ inch.
- Cover the DE-Bleach poultice with the plastic wrap and tape the edges with the plastic tape.
- Let the DE-Bleach poultice stand for 24 hours, then remove the poultice and inspect the area treated.
- If a yellow area is still visible and you are in hurry use a propane torch to heat the area.

The combination of the heat and the bleach can remove the remaining stain.

Add more bleach using a paper towel, if needed but only after using the DE-Bleach poultice for 24 hours.

- Once the green/blue stain is removed flush the area with water to remove all traces of bleach.
- Reseal the surface and you are good to go.
